Do you know what nocturnal means? A nocturnal animal is one that sleeps during the day and stays awake at night. Owls, foxes, and bats can all be nocturnal. These creatures have abilities that help them function in the dark. They’re abilities are ones that non-nocturnal animals don’t have. For instance, their eyes can function well in low light. They also tend to have better hearing and a better sense of smell. This helps them as they navigate dark places.

Being a nocturnal animal helps some animals survive. It helps them avoid predators that roam in the daylight. It also helps them find food among creatures that are sleeping in the dark.
